# A DESCRIPTION OF CHARACTERS ON THE INFINITE WREATH PRODUCT 

A．V．DUDKO AND N．I．NESSONOV

#### Abstract

Let $\mathfrak{S}_{\infty}$ be the infinity permutation group and $\Gamma$ an arbitrary group． Then $\mathfrak{S}_{\infty}$ admits a natural action on $\Gamma^{\infty}$ by automorphisms，so one can form a semidirect product $\Gamma^{\infty} \rtimes \mathfrak{S}_{\infty}$ ，known as the wreath product $\Gamma$ l $\mathfrak{S}_{\infty}$ of $\Gamma$ by $\mathfrak{S}_{\infty}$ ．We obtain a full description of unitary $I_{1}$－factor－representations of $\Gamma$ l $\mathfrak{S}_{\infty}$ in terms of finite characters of $\Gamma$ ．Our approach is based on extending Okounkov＇s classification method for admissible representations of $\mathfrak{S}_{\infty} \times \mathfrak{S}_{\infty}$ ．Also，we discuss certain exam－ ples of representations of type III，where the modular operator of Tomita－Takesaki expresses naturally by the asymptotic operators，which are important in the theory of characters of $\mathfrak{S}_{\infty}$ ．

## 1．Introduction

1．1．A definition of the wreath product．Let $\mathbb{N}$ stand for the natural numbers． A bijection $s: \mathbb{N} \rightarrow \mathbb{N}$ is called finite if the set $\{i \in \mathbb{N} \mid s(i) \neq i\}$ is finite．Define $\mathfrak{S}_{\infty}$ as the group of all finite bijections $\mathbb{N} \rightarrow \mathbb{N}$ and set $\mathfrak{S}_{n}=\left\{s \in \mathfrak{S}_{\infty} \mid s(i)=i \forall i>n\right\}$ ． For every group $\Gamma$ ，an element of $\Gamma^{n}$ can always be written as an ordered collection $\left[\gamma_{k}\right]_{k=1}^{n}=\left(\gamma_{1}, \gamma_{2}, \ldots, \gamma_{n}\right)$ ，where $\gamma_{k} \in \Gamma$ ．Let $e$ be the unit of $\Gamma$ ．For any $n>1$ we identify the element $\left(\gamma_{1}, \gamma_{2}, \ldots, \gamma_{n-1}\right) \in \Gamma^{n-1}$ with $\left(\gamma_{1}, \gamma_{2}, \ldots, \gamma_{n-1}, e\right) \in \Gamma^{n}$ and set $\Gamma_{e}^{\infty}=\underset{\longrightarrow}{\lim } \Gamma^{n}$ ．One can view $\Gamma_{e}^{\infty}$ as a group of infinite ordered collections $\left[\gamma_{k}\right]_{k=1}^{\infty}$ such that there are finitely many elements $\gamma_{k}$ not equal to $e$ ．The wreath product $\Gamma \imath \mathfrak{S}_{n}$ is the semidirect product $\Gamma^{n} \rtimes \mathfrak{S}_{n}$ for the natural permutation action of $\mathfrak{S}_{n}$ on $\Gamma^{n}$（see［4］）． In the same way，we define the group $\Gamma \imath \mathfrak{S}_{\infty}=\Gamma_{e}^{\infty} \rtimes \mathfrak{S}_{\infty} . \Gamma \imath \mathfrak{S}_{\infty}$ can be also viewed as the inductive limit $\underset{\longrightarrow}{\lim } \Gamma$ 积．Using the embedding $\gamma \in \Gamma^{n} \rightarrow(\gamma$ ，id $) \in \Gamma$ 亿 $\mathfrak{S}_{n}$ and $s \in \mathfrak{S}_{n} \rightarrow\left(e^{(n)}, s\right) \in \Gamma \imath \mathfrak{S}_{n}$ ，where $e^{(n)}=(e, e, \ldots, e)$ and id is the identical bijection，we may identify $\Gamma^{n}$ and $\mathfrak{S}_{n}$ with the corresponding subgroups in $\Gamma$ 亿 $\mathfrak{S}_{n}$ ．If $\Gamma$ is a topological group，then we equip $\Gamma^{n}$ with the natural product topology．Furthermore，we will always consider $\Gamma_{e}^{\infty}$ as a topological group with the inductive limit topology．As a set，$\Gamma$ Г $\mathfrak{S}_{\infty}$ is just $\Gamma_{e}^{\infty} \times \mathfrak{S}_{\infty}$ ．Therefore，we equip $\Gamma$ 亿 $\mathfrak{S}_{\infty}$ with the product topology，considering $\mathfrak{S}_{\infty}$ as a discrete topological space．

1．2．The results．In this paper we give a full classification of indecomposable characters （see Definitions（3）－（4））on $\Gamma \imath \mathfrak{S}_{\infty}$（Theorem 9）．Our approach is based on the semigroup method of Olshanski［7］and the ideas of Okounkov used in the study of admissible rep－ resentations of the groups related to $\mathfrak{S}_{\infty}$（see［2］，［3］）．We have noticed that two double cosets containing the transposition or $\gamma \in \Gamma$ commute，as the elements of Olshanski semi－ group．（see Lemma 17）．This observation enables one to develop Okounkov＇s method for the group $\Gamma \mathfrak{\mathfrak { S }} \mathfrak{S}_{\infty}$（see Section 5）．In Section 3 we discuss certain examples of repre－ sentations of type $I I I$ ．The corresponding positive definite functions（p．d．f．）$\varphi$ are not

[^0]characters, but the following holds:
\[

$$
\begin{equation*}
\varphi(s g)=\varphi(g s) \quad \text { for all } \quad g \in \Gamma \imath \mathfrak{S}_{\infty} \quad \text { and } \quad s \in \mathfrak{S}_{\infty} \tag{1.1}
\end{equation*}
$$

\]

Hence the restriction $\left.\varphi\right|_{\mathfrak{S}_{\infty}}$ is a character. At that, the Okounkov's asymptotic operators (see (4.4)) are naturally connected to the Tomita-Takesaki modular operator (see subsection 3.3). In fact, this observation is common for p.d.f. with the property (1.1). For those, we are going to produce a complete classification in a subsequent paper.
1.3. The basic definition and the conjugacy classes. Let $\mathcal{H}$ be a Hilbert space, $\mathcal{B}(\mathcal{H})$ an algebra of all bounded operators in $\mathcal{H}$, and $\mathcal{I}_{\mathcal{H}}$ the identity operator in $\mathcal{H}$. We denote by $\mathcal{U}(\mathcal{H})$ the unitary subgroup in $\mathcal{B}(\mathcal{H})$. By a unitary representation of the topological group $G$ we always mean a continuous homomorphism of $G$ into $\mathcal{U}(\mathcal{H})$, where $\mathcal{U}(\mathcal{H})$ is equipped with the strong operator topology.
Definition 1. A unitary representation $\pi: G \rightarrow \mathcal{U}(\mathcal{H})$ of $G$ is called a factor-representation if the $W^{*}$-algebra $\pi(G)^{\prime \prime}$ generated by the operators $\pi(g)(g \in G)$, is a factor.

Definition 2. A unitary representation $\pi$ is called a factor-representation of finite type if $\pi(G)^{\prime \prime}$ is a factor of type $I I_{1}$.

Let $\mathcal{M}$ be a factor of type $I I_{1}$ and $\mathcal{M}$ a subalgebra of $\mathcal{B}(\mathcal{H})$. If $\pi(G) \subset \mathcal{U}(\mathcal{M})=$ $\mathcal{M} \bigcap \mathcal{U}(\mathcal{H})$ and $\operatorname{tr}_{\mathcal{M}}$ is the unique normal, normalized $(\operatorname{tr}(I)=1)$ trace on $\mathcal{M}$, then it determines a character $\phi_{\pi}^{\mathcal{M}}$ on $G$ by $\phi_{\pi}^{\mathcal{M}}(g)=\operatorname{tr}_{\mathcal{M}}(\pi(g))$.
Definition 3. A continuous function $\phi$ on $G$ is called a character if it satisfies the following properties:
(a) $\phi$ is central, that is, $\phi\left(g_{1} g_{2}\right)=\phi\left(g_{2} g_{1}\right) \forall g_{1}, g_{2} \in G$;
(b) $\phi$ is positive definite, that is, for all $g_{1}, g_{2}, \ldots, g_{n}$ the matrix $\left[\phi\left(g_{j} g_{k}^{-1}\right)\right]_{j, k=1}^{n}$ is non-negatively definite;
(c) $\phi$ is normalized, that is, $\phi\left(e_{G}\right)=1$, where $e_{G}$ is the unit of $G$.

Definition 4. A character $\phi$ is called indecomposable if the group representation corresponding to $\phi$ (according to the GNS construction) is a factor-representation.

In this paper we obtain a complete description of indecomposable characters on $\Gamma\left\langle\mathfrak{S}_{\infty}\right.$ in the case when $\Gamma$ is a separable topological group.

First, let us describe the conjugacy classes in $\Gamma \mathfrak{S _ { \infty }}$. Recall that the conjugacy classes in $\mathfrak{S}_{\infty}$ are parametrized by non-increasing sequences $\lambda=\left(\lambda_{1}, \lambda_{2}, \ldots\right)$ of natural numbers such that there are finitely many elements $\lambda_{k}$ not equal to 1 . Namely, $\lambda_{1}, \lambda_{2}, \ldots$ are the orders of cycles of a permutation $s \in \mathfrak{S}_{\infty}$. Furthermore, an element $\Gamma$ 亿 $\mathfrak{S}_{\infty}$ can be written as a product of an element of $\mathfrak{S}_{\infty}$ and an element of $\Gamma_{e}^{\infty}$, and the commutation rule between these two kinds of elements is as follows:

$$
\begin{equation*}
s \cdot \gamma=s \cdot\left(\gamma_{1}, \gamma_{2}, \ldots\right)=\left(\gamma_{s^{-1}(1)}, \gamma_{s^{-1}(2)}, \ldots\right) \cdot s, \tag{1.2}
\end{equation*}
$$

where $s \in \mathfrak{S}_{\infty}, \gamma=\left(\gamma_{1}, \gamma_{2}, \ldots\right) \in \Gamma_{e}^{\infty}$.
By the analogy with the definition of a cycle in $\mathfrak{S}_{\infty}$ define the generalized cycle in $\Gamma\left\ulcorner\mathfrak{S}_{\infty}\right.$.
Definition 5. Say that element $g=s \cdot \gamma \in \Gamma \imath \mathfrak{S}_{\infty}$, where $\gamma=\left(\gamma_{1}, \gamma_{2}, \ldots\right)$ is generalized cycle if $s$ is cycle and $\left\{i \mid \gamma_{i} \neq e\right\} \subset\{i \mid s(i) \neq i\}$.

Let $s$ be any permutation. Denote $\mathbb{N} / s$ the set of orbits of $s$ on $\mathbb{N}$. Note that for $p \in \mathbb{N} / s$ the permutation $s_{p}$ given by

$$
s_{p}(k)=\left\{\begin{aligned}
s(k), & \text { if } k \in p, \\
k, & \text { otherwise },
\end{aligned}\right.
$$

is a cycle of order $|p|$, where $|p|$ stand for the cardinality of $p$. For $\gamma=\left(\gamma_{1}, \gamma_{2}, \ldots\right) \in \Gamma_{e}^{\infty}$ define the element $\gamma(p)=\left(\gamma_{1}(p), \gamma_{2}(p), \ldots\right) \in \Gamma_{e}^{\infty}$ as follows:

$$
\gamma_{k}(p)=\left\{\begin{align*}
\gamma_{k}, & \text { if } k \in p  \tag{1.3}\\
e, & \text { otherwise }
\end{align*}\right.
$$

Thus, using (1.2), we have the decomposition of $g=s \cdot \gamma$ onto generalized cycles

$$
\begin{equation*}
s \cdot \gamma=\prod_{p \in \mathbb{N} / s} s_{p} \cdot \gamma(p) \tag{1.4}
\end{equation*}
$$

For an arbitrary group $G$ denote by $\mathfrak{c}_{G}(g)$ the conjugacy class of $g \in G$. Let $g=$ $s \cdot \gamma \in \Gamma \succ \mathfrak{S}_{\infty}$. Note that for any orbit $p \in \mathbb{N} / s$ and any $k_{p} \in p$ the conjugacy class $\mathfrak{c}_{\Gamma}\left(\gamma_{k_{p}} \cdot \gamma_{s\left(k_{p}\right)} \cdots \gamma_{s^{(l)}\left(k_{p}\right)} \cdots \gamma_{s(|p|-1)\left(k_{p}\right)}\right)$ does not depend on choice of $k_{p}$. Define the invariant $\mathfrak{i}(g)$ given by unordered $\infty$-tuples of pairs $\left\{\left(|p|, \mathfrak{c}_{\Gamma}\left(\gamma_{k_{p}} \cdot \gamma_{s\left(k_{p}\right)} \cdots \gamma_{s(l)\left(k_{p}\right)} \cdots\right.\right.\right.$ $\left.\left.\left.\gamma_{s(|p|-1)\left(k_{p}\right)}\right)\right)\right\}_{p \in \mathbb{N} / s}$, where $s^{(l)}$ is $l$-th iteration of $s$ and $k_{p}$ - any number from the orbit $p$. The following statement can be easily proved.

Proposition 6. Let $g_{1}$ and $g_{2}$ be elements of $\Gamma$ $\mathfrak{S}_{\infty}$. Then $\mathfrak{c}\left(g_{1}\right)=\mathfrak{c}\left(g_{2}\right)$ if and only if $\mathfrak{i}\left(g_{1}\right)=\mathfrak{i}\left(g_{2}\right)$.

For any $g=s \cdot \gamma \in \Gamma\left\{\mathfrak{S}_{\infty}\right.$ denote $\operatorname{supp}(g)=\left\{i \in \mathbb{N} \mid s(i) \neq i\right.$ or $\left.\gamma_{i} \neq e\right\}$ and call this set the support of $g$. Define for any $\iota \in \Gamma$ and $k \in \mathbb{N}$ the element $\iota(\{k\})=$ $\left(\iota_{1}(\{k\}), \iota_{2}(\{k\}), \ldots, \iota_{l}(\{k\}), \ldots\right) \in \Gamma_{e}^{\infty}$ as follows:

$$
\iota_{l}(\{k\})= \begin{cases}\iota, & \text { if } l=k  \tag{1.5}\\ e, & \text { otherwise }\end{cases}
$$

1.4. The multiplicativity. The following claim gives a useful characterization of the class of indecomposable characters:

Proposition 7. The following assumptions on a character $\phi$ of $\Gamma \mathfrak{\mathfrak { S } _ { \infty }}$ are equivalent:
(a) $\phi$ is indecomposable;
(b) $\phi(g)=\prod_{p \in \mathbb{N} / s} \phi\left(s_{p} \cdot \gamma(p)\right)$ for any $g=s \cdot \gamma=\prod_{p \in \mathbb{N} / s} s_{p} \cdot \gamma(p) \quad$ (see 1.4).

Proof. To prove the proposition, we consider the elements $g=s \cdot \gamma$ and $g^{\prime}=s^{\prime} \cdot \gamma^{\prime}$ of $\Gamma \imath \mathfrak{S}_{\infty}$ such that $\operatorname{supp}(g) \cap \operatorname{supp}\left(g^{\prime}\right)=\emptyset$. Then by the properties of the group $\Gamma \imath \mathfrak{S}_{\infty}$ there exists a sequence $\left\{s_{n}\right\}_{n \in \mathbb{N}} \subset \mathfrak{S}_{\infty}$ such that

$$
\begin{equation*}
s_{n} \cdot g=g \cdot s_{n} \quad \text { and } \quad s_{n} g^{\prime} s_{n}^{-1} \cdot h=h \cdot s_{n} g^{\prime} s_{n}^{-1} \quad \text { for all } \quad h \in \Gamma \imath \mathfrak{S}_{n} \tag{1.6}
\end{equation*}
$$

Suppose now that $(a)$ holds. Using the GNS-construction, we produce the representation $\pi_{\phi}$ of $\Gamma \imath \mathfrak{S}_{\infty}$ which acts in a Hilbert space $\mathcal{H}_{\phi}$ with a cyclic vector $\xi_{\phi}$ such that

$$
\phi(g)=\left(\pi_{\phi}(g) \xi_{\phi}, \xi_{\phi}\right)
$$

Let $A=w-\lim _{n \rightarrow \infty} \pi_{\phi}\left(s_{n} \cdot g^{\prime} s_{n}^{-1}\right)$ be a limit of the sequence $\pi_{\phi}\left(s_{n} \cdot g^{\prime} s_{n}^{-1}\right)$ in the weak operator topology. Using (1.6), we deduce by Definition 4 that $A=a \mathcal{I}$, where $\mathcal{I}$ is the identity operator in $\mathcal{H}_{\phi}$ and $a$ a complex number. Therefore,

$$
\phi\left(g \cdot g^{\prime}\right)=\lim _{n \rightarrow \infty} \phi\left(g \cdot s_{n} \cdot g^{\prime} \cdot s_{n}^{-1}\right)=\phi(g) \cdot \lim _{n \rightarrow \infty} \phi\left(s_{n} \cdot g^{\prime} \cdot s_{n}^{-1}\right)=\phi(g) \cdot \phi\left(g^{\prime}\right)
$$

Thus (b) follows from (a).
Conversely, suppose that (b) holds. For any subset $\mathcal{S}$ of $\mathcal{B}(\mathcal{H})$, define its commutant as follows:

$$
\mathcal{S}^{\prime}=\{T \in \mathcal{B}(\mathcal{H}) \mid S T=T S \text { for all } S \in \mathcal{S}\}
$$

If $\pi_{\phi}\left(\Gamma \imath \mathfrak{S}_{\infty}\right)^{\prime} \bigcap \pi_{\phi}\left(\Gamma \imath \mathfrak{S}_{\infty}\right)^{\prime \prime}=\mathcal{Z}$ is larger than the scalars, then it contains a pair of orthogonal projections $E$ and $F$ with the properties

$$
\begin{equation*}
\phi(E) \neq 0, \quad \phi(F) \neq 0 \quad \text { and } \quad E \cdot F=0 \tag{1.7}
\end{equation*}
$$

By the von Neumann Double Commutant Theorem, for any $\varepsilon>0$ there exist $g_{k}^{E}, g_{k}^{F} \in$ $\Gamma \imath \mathfrak{S}_{n} \subset \Gamma \imath \mathfrak{S}_{\infty}(n<\infty)$ and complex numbers $c_{k}^{E}, c_{k}^{F}(k=1,2, \ldots, N<\infty)$ such that

$$
\begin{align*}
& \left\|\sum_{k=1}^{N} c_{k}^{E} \pi_{\phi}\left(g_{k}^{E}\right) \xi_{\phi}-E \xi_{\phi}\right\|<\varepsilon \phi(E) \\
& \left\|\sum_{k=1}^{N} c_{k}^{F} \pi_{\phi}\left(g_{k}^{F}\right) \xi_{\phi}-F \xi_{\phi}\right\|<\varepsilon \phi(F) \tag{1.8}
\end{align*}
$$

Consider the bijection

$$
\tau(j)=\left\{\begin{aligned}
j+n, & \text { if } j \leq n \\
j-n, & \text { if } n<j \leq 2 n \\
j, & \text { otherwise }
\end{aligned}\right.
$$

By Definition (3), use (1.8) to obtain

$$
\begin{align*}
& \left\|\sum_{k=1}^{N} c_{k}^{E} \pi_{\phi}\left(\tau g_{k}^{E} \tau\right) \xi_{\phi}-E \xi_{\phi}\right\|<\varepsilon \phi(E)  \tag{1.9}\\
& \left\|\sum_{k=1}^{N} c_{k}^{F} \pi_{\phi}\left(\tau g_{k}^{F} \tau\right) \xi_{\phi}-F \xi_{\phi}\right\|<\varepsilon \phi(F)
\end{align*}
$$

Now, using (b), (1.7), (1.8) and (1.9), we have

$$
\begin{aligned}
& \varepsilon \sqrt{\phi(E) \phi(F)}(\varepsilon \sqrt{\phi(E) \phi(F)}+\sqrt{\phi(E)}+\sqrt{\phi(F)}) \\
& \quad>\left|\left(\sum_{k=1}^{N} c_{k}^{E} \pi_{\phi}\left(\tau g_{k}^{E} \tau\right) \cdot \sum_{k=1}^{N} c_{k}^{F} \pi_{\phi}\left(g_{k}^{F}\right) \xi_{\phi}, \xi_{\phi}\right)\right| \\
& \quad>\left|\left(\sum_{k=1}^{N} c_{k}^{E} \pi_{\phi}\left(\tau g_{k}^{E} \tau\right) \xi_{\phi}, \xi_{\phi}\right) \cdot\left(\sum_{k=1}^{N} c_{k}^{F} \pi_{\phi}\left(\tau g_{k}^{F} \tau\right) \xi_{\phi}, \xi_{\phi}\right)\right| \\
& \quad>\phi(E) \phi(F)(\varepsilon+1)^{2} .
\end{aligned}
$$

Hence

$$
\varepsilon>\left[\frac{1-\sqrt{\phi(F)}}{\sqrt{\phi(F)}}+\frac{1-\sqrt{\phi(E)}}{\sqrt{\phi(E)}}\right]^{-1}
$$

Then, comparing this to (1.7), we get a contradiction.
1.5. The main result. In [5], E. Thoma obtained the following remarkable description of all indecomposable characters of $\mathfrak{S}_{\infty}$. The characters of $\mathfrak{S}_{\infty}$ are labeled by pairs of non-increasing positive sequences of numbers $\left\{\alpha_{k}\right\},\left\{\beta_{k}\right\}(k \in \mathbb{N})$ (which are called the Thoma parameters) such that

$$
\begin{equation*}
\sum_{k=1}^{\infty} \alpha_{k}+\sum_{k=1}^{\infty} \beta_{k} \leq 1 \tag{1.10}
\end{equation*}
$$

The value of the corresponding character on a permutation with a single cycle of length $l$ is

$$
\sum_{k=1}^{\infty} \alpha_{k}^{l}+(-1)^{l-1} \sum_{k=1}^{\infty} \beta_{k}^{l}
$$

Its value on a permutation with several disjoint cycles equals the product of values on each cycle.

Let $g=s \cdot \gamma, p \in \mathbb{N} / s$ be one of the orbits of $s$. Then put

$$
\begin{equation*}
\tilde{\gamma}(p)=\gamma_{k} \cdot \gamma_{s^{-1}(k)} \cdots \gamma_{s^{(-l)}(k)} \cdots \gamma_{s^{(-|p|+1)}(k)}, \quad \text { where } \quad(k \in p) \tag{1.11}
\end{equation*}
$$

Now we define an analog of Thoma parameters for characters of the group $\Gamma$ l $\mathfrak{S}_{\infty}$. Namely, let us call Thoma parameters the collection $\varrho^{0},\left\{\varrho^{\alpha_{k}}\right\},\left\{\varrho^{\beta_{k}}\right\},\left\{\alpha_{k}\right\},\left\{\beta_{k}\right\}$, where $\varrho^{0}$ is the representation of $\Gamma$ of finite type, $\alpha=\left\{\alpha_{k}\right\}, \beta=\left\{\beta_{k}\right\}$ are non-increasing finite or infinite sequences of positive numbers, $\varrho^{\alpha}=\left\{\varrho^{\alpha_{k}}\right\}$ and $\varrho^{\beta}=\left\{\varrho^{\beta_{k}}\right\}$ are sequences of finitedimensional irreducible representations of $\Gamma$ such that $\sum_{k}\left(\alpha_{k} \cdot \operatorname{dim} \varrho^{\alpha_{k}}+\beta_{k} \cdot \operatorname{dim} \varrho^{\beta_{k}}\right) \leq 1$.
For Thoma parameters $\varrho^{0},\left\{\varrho^{\alpha_{k}}\right\},\left\{\varrho^{\beta_{k}}\right\},\left\{\alpha_{k}\right\},\left\{\beta_{k}\right\}$ we define a function $\phi=\phi_{\varrho^{0}, \varrho^{\alpha}, \varrho^{\beta}, \alpha, \beta}$ by the next three properties:
(1) for $g=s \cdot \gamma \in \Gamma \imath \mathfrak{S}_{\infty}$ one has

$$
\phi(g)=\prod_{p \in \mathbb{N} / s} \phi(s(p) \cdot \gamma(p)) \quad(\text { see }(1.2)-(1.3))
$$

(2) for the generalized cycle $g=s \cdot \gamma$ (see definition 5) with $p=\operatorname{supp}(g)$ and $s \neq \mathrm{id}$ one has

$$
\phi(g)=\sum_{k=1}^{\infty}\left(\alpha_{k}^{|p|} \cdot \operatorname{Tr}\left(\varrho^{\alpha_{k}}(\tilde{\gamma}(p))\right)+(-1)^{|p|-1} \beta_{k}^{|p|} \cdot \operatorname{Tr}\left(\varrho^{\beta_{k}}(\tilde{\gamma}(p))\right)\right)
$$

(3) for each $\iota \in \Gamma$ and $n \in \mathbb{N}$ one has

$$
\begin{aligned}
\phi(\iota(\{n\})) & =\sum_{k=1}^{\infty}\left(\alpha_{k} \cdot \operatorname{Tr}\left(\varrho^{\alpha_{k}}(\iota)\right)+\beta_{k} \cdot \operatorname{Tr}\left(\varrho^{\beta_{k}}(\iota)\right)\right) \\
& +\left(1-\sum_{k \in \mathbb{N}}\left(\alpha_{k} \cdot \operatorname{dim} \varrho^{\alpha_{k}}+\beta_{k} \cdot \operatorname{dim} \varrho^{\beta_{k}}\right)\right) \operatorname{tr}_{0}(\iota) \quad(\operatorname{see}(1.5))
\end{aligned}
$$

where $\operatorname{Tr}$ is the ordinary trace and $\operatorname{tr}_{0}$ is the normalized character of the representation $\varrho^{0}$.
Proposition 8. The function $\phi_{\varrho^{0}}, \varrho^{\alpha}, \varrho^{\beta}, \alpha, \beta$ is an indecomposable character (see definition 3).

Proof. The realizations of the corresponding factor-representations we give in the section 2.

Here is our main result.
Theorem 9. If $\phi$ is an indecomposable character on $\Gamma\urcorner \mathfrak{S}_{\infty}$, then there exist Thoma parameters $\varrho^{0},\left\{\varrho^{\alpha_{k}}\right\},\left\{\varrho^{\beta_{k}}\right\},\left\{\alpha_{k}\right\},\left\{\beta_{k}\right\}$, such that $\phi=\phi_{\varrho^{0}}, \varrho^{\alpha}, \varrho^{\beta}, \alpha, \beta$.

## 2. REALIZATIONS OF $I I_{1}$-FACTOR-REPRESENTATIONS

A complete family of $I I_{1}$-factor-representations of $\Gamma \imath \mathfrak{S}_{\infty}$ can be constructed using the Vershik-Kerov [8], Olshanski [7] realizations or Okunkov methods (so called mixtures of representations) [3], found for the $I I_{1}$-factor-representations of the infinite symmetric group $\mathfrak{S}_{\infty}$. We follow the approach developed by Olshanski as it leads to less spadework.
2.1. A construction of representations. Let $\left\{\alpha_{k}\right\}_{k \in \mathbb{N}},\left\{\beta_{k}\right\}_{k \in \mathbb{N}}$ be two finite or infinite sets of the positive numbers from $(0,1)$ and let $\varrho^{\alpha_{k}}$ and $\varrho^{\beta_{k}}$ be unitary irreducible finite-dimensional representations of $\Gamma$ that act in the Hilbert spaces $\mathcal{H}^{\alpha_{k}}$ and $\mathcal{H}^{\beta_{k}}$ correspondingly. We assume, that

$$
\sum_{k} \alpha_{k} \cdot \operatorname{dim} \varrho^{\alpha_{k}}+\sum_{k} \beta_{k} \cdot \varrho^{\beta_{k}} \leq 1
$$

We set

$$
\delta=1-\sum_{k} \alpha_{k} \cdot \operatorname{dim} \varrho^{\alpha_{k}}-\sum_{k} \beta_{k} \cdot \varrho^{\beta_{k}}
$$

Let $\mathcal{H}^{0}$ stand for the Hilbert space, where acts the unitary representation of a finite type $\varrho^{0}$ of $\Gamma$. Then the formula $\operatorname{tr}^{0}(\gamma)=\left(\varrho^{0}(\gamma) \xi^{(0)}, \xi^{(0)}\right)_{\mathcal{H}^{0}}$ defines the character on $\Gamma$. We denote by $\left(\varrho^{0 k}, \mathcal{H}^{0 k}, \xi^{(0 k)}\right)$ the k-th copy of the triplet $\left(\varrho^{0}, \mathcal{H}^{0}, \xi^{(0)}\right)$.

Let $\left\{\mathrm{e}_{j}^{\left(\alpha_{k}\right)}\right\}_{1 \leq j \leq \operatorname{dim} \mathcal{H}^{\alpha_{k}}}$ be an orthonormal basis in $\mathcal{H}^{\alpha_{k}}$. Let

$$
\mathbf{H}=\left(\left(\underset{k}{\oplus} \mathcal{H}^{\alpha_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{\beta_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{0 k}\right)\right) \otimes\left(\left(\underset{k}{\oplus} \mathcal{H}^{\alpha_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{\beta_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{0 k}\right)\right)
$$

and let
$\eta^{(m)}=\sum_{k} \sqrt{\alpha_{k}}\left(\sum_{j} \mathrm{e}_{j}^{\left(\alpha_{k}\right)} \otimes \mathrm{e}_{j}^{\left(\alpha_{k}\right)}\right)+\sum_{k} \sqrt{\beta_{k}}\left(\sum_{j} \mathrm{e}_{j}^{\left(\beta_{k}\right)} \otimes \mathrm{e}_{j}^{\left(\beta_{k}\right)}\right)+\sqrt{\delta} \xi^{(0 m)} \otimes \xi^{(0 m)}$.
Define the unitary representation $\varrho$ of $\Gamma$ in $\mathbf{H}$ as follows

$$
\begin{equation*}
\varrho=\left(\left(\underset{k}{\oplus} \varrho^{\alpha_{k}}\right) \oplus\left(\underset{k}{\oplus} \varrho^{\beta_{k}}\right) \oplus\left(\underset{k}{\oplus} \varrho^{0 k}\right)\right) \otimes I \tag{2.1}
\end{equation*}
$$

We will identify $\mathcal{H}^{\alpha_{k}} \otimes \mathcal{H}^{\alpha_{k}}, \mathcal{H}^{\beta_{k}} \otimes \mathcal{H}^{\beta_{k}}$ and $\left(\underset{k}{\oplus} \mathcal{H}^{0 k}\right) \otimes\left(\underset{k}{\oplus} \mathcal{H}^{0 k}\right)$ with their images with respect in the natural embedding to $\mathbf{H}$. Denote by $\mathbf{H}^{m}$ the $m$-th copy of the Hilbert space $\mathbf{H}$ and consider the infinite tensor product

$$
\breve{\mathbf{H}}=\bigotimes_{m}\left(\mathbf{H}^{m}, \eta^{(m)}\right)
$$

It is convenient to represent $\breve{\mathbf{H}}$ as the closure of the linear span of the vectors of the form $\zeta_{1} \otimes \zeta_{2} \otimes \cdots \otimes \zeta_{m-1} \otimes \eta^{(m)} \otimes \eta^{(m+1)} \otimes \cdots$, where $\zeta_{j}$ is an any vector from $\mathbf{H}^{j}$.
We extend the set $\left\{\mathrm{e}_{j}^{\left(\alpha_{k}\right)}\right\}_{j=1}^{\operatorname{dim} \mathcal{H}^{\alpha_{k}}} \cup\left\{\mathrm{e}_{j}^{\left(\beta_{k}\right)}\right\}_{j=1}^{\operatorname{dim} \mathcal{H}^{\beta_{k}}}$ to an orthonormal basis $\mathfrak{A}$ in $\left(\underset{k}{\oplus} \mathcal{H}^{\alpha_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{\beta_{k}}\right) \oplus\left(\underset{k}{\oplus} \mathcal{H}^{0 k}\right)$. Now we fix the orthonormal basis

$$
\mathfrak{B}=\left\{\mathrm{e}_{j} \otimes \mathrm{e}_{l}: \mathrm{e}_{j}, \mathrm{e}_{l} \in \mathfrak{A}\right\}
$$

in $\mathbf{H}$ and we assume below $\zeta_{j} \in \mathfrak{B}$. Let components of the vector $\breve{\zeta}=\zeta_{1} \otimes \zeta_{2} \otimes$ $\cdots \otimes \zeta_{m-1} \otimes \cdots$ be of the form $\zeta_{j}=v_{j} \otimes \tau_{j}$. Define for $\mathfrak{s} \in \mathfrak{S}_{\infty}$ the vector $\mathfrak{s}(\zeta)=$ $\vartheta_{1} \otimes \vartheta_{2} \otimes \cdots \otimes \vartheta_{m-1} \otimes \cdots$ as follows:

$$
\vartheta_{j}=v_{s^{-1}(j)} \otimes \tau_{j}
$$

Now build the sequence $\mathfrak{j}(\breve{\zeta})=\left\{j_{1}<j_{2}<\cdots\right\}$ such, that

$$
\zeta_{j_{l}}=\mathrm{e}_{m}^{\left(\beta_{k}\right)} \otimes \mathrm{f} \quad \text { for some } \quad \beta_{k} \quad \text { and } \quad m
$$

Let $\mathfrak{t}$ be a permutation for which $\mathfrak{s}\left(\left(j_{\mathfrak{t}(1)}\right)\right)<\mathfrak{s}\left(\left(j_{\mathfrak{t}(2)}\right)\right)<\cdots<\mathfrak{s}\left(\left(j_{\mathfrak{t}(l)}\right)\right)<\cdots$. Finally, we set $\psi(\mathfrak{s}, \breve{\zeta})=\operatorname{sgn}(\mathfrak{t})$. The corresponding representation $\pi$ of $\Gamma \imath \mathfrak{S}_{\infty}$ can be realized in Hilbert space $\breve{\mathbf{H}}$ as follows:

$$
\begin{align*}
& \pi(\gamma)\left(\zeta_{1} \otimes \zeta_{2} \otimes \cdots \otimes \zeta_{m-1} \otimes \eta^{(m)} \otimes \cdots\right) \\
& \quad=\varrho\left(\gamma_{1}\right) \zeta_{1} \otimes \varrho\left(\gamma_{2}\right) \zeta_{2} \otimes \cdots \otimes \varrho\left(\gamma_{m-1}\right) \zeta_{m-1} \otimes \varrho\left(\gamma_{m}\right) \eta^{(m)} \otimes \cdots  \tag{2.2}\\
& \text { and for } \quad \mathfrak{s} \in \mathfrak{S}_{\infty} \quad \pi(\mathfrak{s})\left(\zeta_{1} \otimes \zeta_{2} \otimes \cdots \otimes \zeta_{m-1} \otimes \cdots\right)=\psi(\mathfrak{s}, \breve{\zeta}) \mathfrak{s}(\breve{\zeta})
\end{align*}
$$

2.2. The character's formula. Set $\breve{\eta}=\bigotimes_{m} \eta^{(m)}$. Assume that $\mathfrak{s}$ is the cycle $(1 \rightarrow$ $2 \rightarrow 3 \rightarrow \cdots \rightarrow k-1 \rightarrow k)$, where $k>1$. Let $\gamma=\left(\gamma_{1}, \gamma_{2}, \ldots, \gamma_{k}, e_{\Gamma}, e_{\Gamma}, \ldots\right)$. Routine calculations provide that

$$
\begin{equation*}
(\pi(\mathfrak{s} \gamma) \breve{\eta}, \breve{\eta})=\sum_{j} \alpha_{j}^{k} \operatorname{Tr}\left(\varrho^{\alpha_{j}}\left(\gamma_{1} \gamma_{2} \cdots \gamma_{k}\right)\right)+\sum_{j} \beta_{j}^{k} \operatorname{Tr}\left(\varrho^{\beta_{j}}\left(\gamma_{1} \gamma_{2} \cdots \gamma_{k}\right)\right) \tag{2.3}
\end{equation*}
$$

where $\operatorname{Tr}\left(\varrho^{r}(\gamma)\right)=\sum_{j=1}^{\operatorname{dim} \varrho^{r}} \varrho_{j j}^{r}(\gamma)$.
It is obvious, that

$$
(\pi(\gamma) \breve{\eta}, \breve{\eta})=\prod_{j=1}^{k}\left(\sum_{i} \alpha_{i} \operatorname{Tr}\left(\varrho^{\alpha_{i}}\left(\gamma_{j}\right)\right)+\sum_{i} \beta_{i} \operatorname{Tr}\left(\varrho^{\beta_{i}}\left(\gamma_{j}\right)\right)+\left(\varrho^{0}\left(\gamma_{j}\right) \xi^{(0)}, \xi^{(0)}\right)\right)
$$

Since $\operatorname{tr}^{0}$ is a character on $\Gamma$, one can use (2.3) and the multiplicativity property (see Proposition 7) to obtain the following

Corollary 10. Let $\chi(g)=(\pi(g) \breve{\eta}, \breve{\eta})$. Then $\chi$ is an indecomposable character on $\Gamma \backslash \mathfrak{S}_{\infty}$.

## 3. Other examples

In this section we construct examples of infinite type representations of $\mathbb{Z}_{2} \imath \mathfrak{S}_{\infty}$. The corresponding positive definite functions are not characters. On the other hand they satisfy the following condition:

$$
\varphi(s g)=\varphi(g s) \quad \text { for all } \quad g \in G=\Gamma \imath \mathfrak{S}_{\infty} \quad \text { and } \quad s \in \mathfrak{S}_{\infty}
$$

In the generic case the representation $\pi_{\varphi}$ built by GNS-construction from $\varphi$ is of type III. Furthermore, the state $\varphi$ on the $W^{*}$-algebra $\pi_{\varphi}(G)^{\prime \prime}$ is faithful. These properties allow one to construct the Tomita-Takesaki modular operator $\Delta_{\varphi}$. Surprisingly, $\Delta_{\varphi}$ is naturally related to the Okounkov operator $\mathcal{O}_{k}$ (see (4.4)), which is an important object in the representation theory of symmetric group (see [2], [3]).
3.1. A construction. Let $X_{i}=\mathbb{Z}_{2} \times \mathbb{Z}_{2}=\{0,1\} \times\{0,1\}$. Define a probability measure $\nu_{i}$ on $X_{i}$ by $\nu_{i}((k, l))=p_{k l}$. Let $(X, \mu)=\prod_{i}\left(X_{i}, \nu_{i}\right)$ and $x=\left(x_{i}\right) \in X$, where $x_{i}=$ $\left(x_{i}^{(0)}, x_{i}^{(1)}\right) \in X_{i}, x_{i}^{(k)} \in\{0,1\}$. Define an action $\mathfrak{a}$ of $g=\left(s_{0}, s_{1}\right) \in \mathfrak{S}_{\infty} \times \mathfrak{S}_{\infty}$ on $(X, \mu)$ as follows:

$$
\left(\mathfrak{a}_{g}(x)\right)_{i}^{(k)}=x_{s_{k}(i)}^{(k)} \quad(k=0,1)
$$

Remark 1. The measure $\mu$ is $\mathfrak{G}_{\infty} \times \mathfrak{G}_{\infty}$-quasiinvariant if and only if $p_{i j} \neq 0$ for all $i, j=0,1$.

We are about to construct a unitary representation $\pi_{\mu}$ of $G \times G$ in $L^{2}(X, \mu)$. With $\varsigma \in L^{2}(X, \mu)$ set

$$
\begin{align*}
& \left(\pi_{\mu}\left(\left(s_{0}, s_{1}\right)\right) \varsigma\right)(x)=\left(\frac{d \mu\left(\mathfrak{a}_{g}(x)\right)}{d \mu(x)}\right)^{\frac{1}{2}} \varsigma\left(\mathfrak{a}_{g}(x)\right) \\
& \left(\pi_{\mu}\left(\left(\gamma^{(0)}, \gamma^{(1)}\right)\right) \varsigma\right)(x)=(-1)^{\left(\sum_{i, k} \gamma_{i}^{(k)} x_{i}^{(k)}\right)} \varsigma(x) \tag{3.1}
\end{align*}
$$

where $\gamma^{(0)}=\left(\gamma_{i}^{(0)}\right) \in \mathbb{Z}_{2}^{\infty}, \gamma^{(1)}=\left(\gamma_{i}^{(1)}\right) \in \mathbb{Z}_{2}^{\infty}$, and $\left(\gamma^{(0)}, \gamma^{(1)}\right) \in \mathbb{Z}_{2}^{\infty} \times \mathbb{Z}_{2}^{\infty}$. Let $\pi_{\mu}^{(0)}(g)=\pi_{\mu}\left(\left(g, e_{G}\right)\right)$ and $\pi_{\mu}^{(1)}(g)=\pi_{\mu}\left(\left(e_{G}, g\right)\right)$.
Proposition 11. $\pi_{\mu}$ is irreducible. Hence, $\pi_{\mu}^{(0)}$ and $\pi_{\mu}^{(1)}$ are factor-representations of $\Gamma \imath \mathfrak{S}_{\infty}$.

Proof. Obvious.
3.2. A cyclic separating vector. Let $\mathbb{I}$ be an element of $L^{2}(X, \mu)$ given by the function identically equal to 1 .

Theorem 12. If $\operatorname{det}\left[p_{i j}\right] \neq 0$, then $\mathbb{I}$ is a cyclic separating vector for $\pi_{\mu}^{(0)}(G)^{\prime \prime}$ and $\pi_{\mu}^{(1)}(G)^{\prime \prime}$. That is,

$$
\left[\pi_{\mu}^{(0)}(G)^{\prime \prime} \mathbb{I}\right]=\left[\pi_{\mu}^{(1)}(G)^{\prime \prime} \mathbb{I}\right]=L^{2}(X, \mu)
$$

Proof. Let $(k, l)$ be a transposition from $\mathfrak{S}_{\infty}$. First notice that the operator

$$
\mathcal{O}_{k}^{(j)}=\lim _{n \rightarrow \infty} \frac{1}{n} \sum_{l=1}^{n} \pi_{\mu}^{(j)}((k, l)) \quad(\text { see }(4.4))
$$

belongs to $\pi_{\mu}^{(j)}(G)^{\prime \prime}(j=0,1)$. Since

$$
\left(L^{2}(X, \mu), \mathbb{I}\right)=\bigotimes_{i=1}^{\infty}\left(L^{2}\left(X_{i}, \nu_{i}\right), \mathbb{I}\right)
$$

one can apply the law of large numbers to deduce that

$$
\mathcal{O}_{i}^{(j)}=I \otimes I \otimes \cdots \otimes \underset{i-t h}{\mathcal{O}_{i}^{(j, i)}} \otimes I \otimes \cdots
$$

Furthermore, if $\chi_{k l}^{(i)}$ is the indicator of the point $(k, l) \in X_{i}=\mathbb{Z}_{2} \times \mathbb{Z}_{2}$, the matrices of $\mathcal{O}_{i}^{(0, i)}$ and $\mathcal{O}_{i}^{(1, i)}$ in the orthonormal basis $\left\{\mathrm{e}_{k l}^{(i)}=\frac{\chi_{k l}^{(i)}}{\sqrt{p_{k l}}}\right\}_{k, l=0,1}$ are as follows:

$$
\begin{gather*}
\mathcal{O}_{i}^{(0, i)} \leftrightarrow\left[\begin{array}{cccc}
p_{00}+p_{01} & 0 & \sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} & 0 \\
0 & p_{00}+p_{01} & 0 & \sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} \\
\sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} & 0 & p_{10}+p_{11} & 0 \\
0 & \sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} & 0 & p_{10}+p_{11}
\end{array}\right],  \tag{3.2}\\
\mathcal{O}_{i}^{(1, i)} \leftrightarrow\left[\begin{array}{cccc}
p_{00}+p_{10} & \sqrt{p_{00} p_{01}}+\sqrt{p_{10} p_{11}} & 0 & 0 \\
\sqrt{p_{00} p_{01}+\sqrt{p_{10} p_{11}}} \begin{array}{c}
p_{01}+p_{11} \\
0
\end{array} 0 & 0 & 0 \\
0 & 0 & \sqrt{p_{00} p_{01}}+\sqrt{p_{10} p_{11}} & p_{01}+p_{11}
\end{array}\right]
\end{gather*}
$$

By the construction,

$$
\pi_{\mu}^{(k)}\left(\gamma^{(k)}\right)=\bigotimes_{i=1}^{\infty} \pi_{\mu}^{(k, i)}\left(\gamma_{i}^{(k)}\right)
$$

where $\pi_{\mu}^{(0, i)}\left(\gamma_{i}^{(0)}\right)$ and $\pi_{\mu}^{(1, i)}\left(\gamma_{i}^{(1)}\right)$ are determined by the matrices

$$
\left[\begin{array}{cccc}
1 & 0 & 0 & 0  \tag{3.3}\\
0 & 1 & 0 & 0 \\
0 & 0 & (-1)^{\gamma_{i}^{(0)}} & 0 \\
0 & 0 & 0 & (-1)^{\gamma_{i}^{(0)}}
\end{array}\right] \text { and }\left[\begin{array}{cccc}
1 & 0 & 0 & 0 \\
0 & (-1)^{\gamma_{i}^{(1)}} & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & (-1)^{\gamma_{i}^{(1)}}
\end{array}\right]
$$

Use the map

$$
\mathfrak{I}_{i}: \sum_{m, n=0,1} a_{m n} \mathrm{e}_{m n}^{(i)} \rightarrow\left[\begin{array}{ll}
a_{00} & a_{01}  \tag{3.4}\\
a_{10} & a_{11}
\end{array}\right]
$$

to identify $L^{2}\left(X_{i}, \nu_{i}\right)$ to the full matrix algebra $M_{2}(\mathbb{C})$, so that

$$
\Im_{i}(\mathbb{I})=\left[\begin{array}{ll}
\sqrt{p_{00}} & \sqrt{p_{01}} \\
\sqrt{p_{10}} & \sqrt{p_{11}}
\end{array}\right]
$$

Equip $M_{2}(\mathbb{C})$ with the Hermitian form

$$
\langle a, b\rangle_{i}=\operatorname{Tr}\left(b^{*} a\right)
$$

then $\mathfrak{I}_{i}$ is a unitary and $\mathfrak{I}_{i} L^{2}\left(X_{i}, \nu_{i}\right)=M_{2}(\mathbb{C})$. Now as an elementary consequence of (3.2) and (3.3) one has:

$$
\begin{aligned}
& \mathfrak{I}_{i} \mathcal{O}_{i}^{(0, i)} \mathfrak{I}_{i}^{-1} a=\left[\begin{array}{cc}
p_{00}+p_{01} & \sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} \\
\sqrt{p_{00} p_{10}}+\sqrt{p_{01} p_{11}} & p_{10}+p_{11}
\end{array}\right] a, \\
& \mathfrak{I}_{i} \mathcal{O}_{i}^{(1, i)} \mathfrak{I}_{i}^{-1} a=a\left[\begin{array}{cc}
p_{00}+p_{10} & \sqrt{p_{00} p_{01}}+\sqrt{p_{10} p_{11}} \\
\sqrt{p_{00} p_{01}}+\sqrt{p_{10} p_{11}} & p_{01}+p_{11}
\end{array}\right], \\
& \mathfrak{I}_{i} \pi_{\mu}^{(0, i)}\left(\gamma_{i}^{(0)}\right) \mathfrak{I}_{i}^{-1} a=\left[\begin{array}{cc}
1 & 0 \\
0 & (-1)^{\gamma_{i}^{(0)}}
\end{array}\right] a, \\
& \mathfrak{I}_{i} \pi_{\mu}^{(1, i)}\left(\gamma_{i}^{(1)}\right) \mathfrak{I}_{i}^{-1} a=a\left[\begin{array}{cc}
1 & 0 \\
0 & (-1)^{\gamma_{i}^{(1)}}
\end{array}\right], \quad \text { where } \quad a \in M_{2}(\mathbb{C}) .
\end{aligned}
$$

Thus, in view of Remark 1 (see p. 307), the algebra $\mathfrak{M}_{i}^{k}$ generated by the operators $\mathfrak{I}_{i} \mathcal{O}_{i}^{(k, i)} \mathfrak{I}_{i}^{-1}$ and $\mathfrak{I}_{i} \pi_{\mu}^{(0, i)}\left(\gamma_{i}^{(k)}\right) \mathfrak{I}_{i}^{-1}$ is just $M_{2}(\mathbb{C})$. Since $\operatorname{det}\left(\mathfrak{I}_{i}(\mathbb{I})\right) \neq 0$, one has finally $\mathfrak{M}_{i}^{0} \mathfrak{I}_{i}(\mathbb{I})=\mathfrak{M}_{i}^{1} \mathfrak{I}_{i}(\mathbb{I})=M_{2}(\mathbb{C})$.
3.3. The modular operator. Consider the Hilbert space $\mathfrak{H}=\bigotimes_{i=1}^{\infty}\left(M_{2}(\mathbb{C}),\langle \rangle_{i}, \mathfrak{I}_{i}(\mathbb{I})\right)$. It is convenient to represent $\mathfrak{H}$ as the closure of the linear span of the vectors $a_{1} \otimes a_{2} \otimes$ $\cdots \otimes a_{i} \otimes \mathfrak{I}_{i+1}(\mathbb{I}) \otimes \mathfrak{I}_{i+2}(\mathbb{I}) \cdots$, where $a_{i} \in M_{2}(\mathbb{C})$. If $\mathfrak{I}=\bigotimes_{i=1}^{\infty} \mathfrak{I}_{i}$, one has by Theorem 12

$$
\mathfrak{I} L^{2}(X, \mu)=\mathfrak{H}
$$

Let $\mathcal{L}(\mathfrak{H})$ and $\mathcal{R}(\mathfrak{H})$ be the $W^{*}$-algebras generated in $\mathfrak{H}$ by the operators of left and right multiplication by elements of the form $a_{1} \otimes a_{2} \otimes \cdots \otimes a_{i} \otimes I_{2} \otimes I_{2} \otimes \cdots, \quad$ where $\quad a_{i} \in M_{2}(\mathbb{C}), \quad I_{2}=\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right]$.
Proposition 13. $\pi_{\mu}^{(0)}(G)^{\prime \prime}=\mathfrak{I}^{-1} \mathcal{L}(\mathfrak{H}) \mathfrak{I}$ and $\pi_{\mu}^{(1)}(G)^{\prime \prime}=\mathfrak{I}^{-1} \mathcal{R}(\mathfrak{H}) \mathfrak{I}$.

Proof. Let $\mathfrak{A}_{n}^{(j)}$ stand for the $W^{*}$-algebra generated by the operators $\left\{\mathcal{O}_{i}^{(j)}\right\}_{i=1}^{n}$ and $\left\{\pi_{\mu}^{(j)}\left(\Gamma^{n}\right)\right\}(j=0,1)$. In view of (3.5), $\mathfrak{A}_{n}^{(j)}$ is isomorphic $\bigotimes_{i=1}^{n} M_{2}(\mathbb{C})$. Therefore, $\pi_{\mu}^{(j)}\left(\mathfrak{S}_{n}\right) \subset \mathfrak{A}_{n}^{(j)}$. Finally, use $(3.5)$ deduce $\mathfrak{A}_{n}^{(0)} \subset \mathcal{L}(\mathfrak{H})$ and $\mathfrak{A}_{n}^{(1)} \subset \mathcal{R}(\mathfrak{H})$.

Let $\xi=\mathfrak{I}_{1}(\mathbb{I}) \otimes \mathfrak{I}_{2}(\mathbb{I}) \otimes \cdots \otimes \mathfrak{I}_{i+2}(\mathbb{I}) \otimes \cdots$. Since the vector $\xi$ is cyclic and separating for $\mathcal{L}(\mathfrak{H})$ (Theorem 12), one can construct the modular operator $\Delta_{\xi}$ (see [9]). Namely, if $S$ and $F$ are closures of antilinear operators given by

$$
S(a \xi)=a^{*} \xi \quad \text { for all } \quad a \in \mathcal{L}(\mathfrak{H}) \quad \text { and } \quad F\left(\xi a^{\prime}\right)=\xi\left(a^{\prime}\right)^{*} \quad \text { for all } \quad a^{\prime} \in \mathcal{R}(\mathfrak{H})
$$

then

$$
F=S^{*} \quad \text { and } \quad \Delta_{\xi}=F S
$$

Hence, with $a=a_{1} \otimes a_{2} \otimes \cdots \otimes a_{i} \otimes I_{2} \otimes I_{2} \otimes \cdots$ one has

$$
a^{*} \xi=\xi \cdot\left(\bigotimes_{j=1}^{i} \mathfrak{I}_{j}(\mathbb{I})\right)^{-1} \otimes I_{2} \otimes I_{2} \otimes \cdots \cdot a^{*} \cdot\left(\bigotimes_{j=1}^{i} \mathfrak{I}_{j}(\mathbb{I})\right) \otimes I_{2} \otimes I_{2} \otimes \cdots
$$

Therefore,

$$
\Delta_{\xi}(a \xi)=F\left(a^{*} \xi\right)=\xi \cdot\left(\bigotimes_{j=1}^{i} \mathfrak{I}_{j}(\mathbb{I})\right)^{*} \otimes I_{2} \otimes \cdots \cdot a \cdot\left(\bigotimes_{j=1}^{i}\left(\mathfrak{I}_{j}(\mathbb{I})\right)^{*}\right)^{-1} \otimes I_{2} \otimes \cdots
$$

Finally, use the relation $\mathfrak{I}_{j}(\mathbb{I})\left(\mathfrak{I}_{j}(\mathbb{I})\right)^{*}=\mathfrak{I}_{j} \mathcal{O}_{j}^{(0, j)} \mathfrak{I}_{j}^{-1}$ (see (3.5)) to obtain

$$
\begin{align*}
\Delta_{\xi}(a \xi) & =\bigotimes_{j=1}^{i}\left(\mathfrak{I}_{j} \mathcal{O}_{j}^{(0, j)} \mathfrak{I}_{j}^{-1}\right) a\left(\bigotimes_{j=1}^{i} \mathfrak{I}_{j} \mathcal{O}_{j}^{(0, j)} \mathfrak{I}_{j}^{-1}\right)^{-1}  \tag{3.6}\\
& \otimes \mathfrak{I}_{i+1}(\mathbb{I}) \otimes \mathfrak{I}_{i+2}(\mathbb{I}) \otimes \cdots
\end{align*}
$$

Thus the modular operator $\Delta_{\xi}$ is defined in a natural way by the Okounkov operator $\mathcal{O}_{j}$ (see (4.4), [2], [3]).
4. The characters of $G$ and spherical functions of the pair $(G \times G$, $\operatorname{diag} G)$

In what follows, $\left(\pi_{\phi}, \mathcal{H}_{\phi}, \xi_{\phi}\right)$ is the unitary representation of $G=\Gamma$ 亿 $\mathfrak{S}_{\infty}$ that corresponds by GNS-construction to the character $\phi$. In particular, the operators $\pi(G)$ act in $\mathcal{H}_{\phi}$ with cyclic separating vector $\xi_{\phi}$. That is,

$$
\begin{equation*}
\left[\pi_{\phi}(G) \xi_{\phi}\right]=\left[\pi_{\phi}(G)^{\prime} \xi_{\phi}\right]=\mathcal{H}_{\phi} \tag{4.1}
\end{equation*}
$$

where $[\mathcal{S}]$ stands for the closed subspace in $\mathcal{H}_{\phi}$ generated by $\mathcal{S}$. Moreover $\phi(g)=$ $\left(\pi_{\phi}(g) \xi_{\phi}, \xi_{\phi}\right)$ for all $g \in G$.

The property (4.1) allows one to produce a unitary spherical representation $\pi_{\phi}^{(2)}$ of the Olshanski pair $(G \times G, K)$, where $K=\operatorname{diag} G=\{(g, g)\}_{g \in G}$. Namely,

$$
\begin{equation*}
\pi_{\phi}^{(2)}\left(g_{1}, g_{2}\right) x \xi_{\phi}=\pi_{\phi}\left(g_{1}\right) x \pi_{\phi}\left(g_{2}\right)^{*} \xi_{\phi} \quad \text { for all } \quad x \in \pi_{\phi}(G)^{\prime \prime} \tag{4.2}
\end{equation*}
$$

Let

$$
\begin{gathered}
G_{n}(\infty)=\left\{g=s \cdot \gamma \in G \mid s(l)=l \text { and } \gamma_{l}=e \text { for all } l=1,2, \ldots, n\right\} \\
K_{n}(\infty)=K \cap\left(G_{n}(\infty) \times G_{n}(\infty)\right), \quad G_{n}=\Gamma \imath \mathfrak{S}_{n}, \quad K_{n}=\left(G_{n} \times G_{n}\right) \cap K .
\end{gathered}
$$

It follows from the definition that $G_{0}(\infty)=G_{\infty}=G, K_{0}(\infty)=K_{\infty}=K$.
Set

$$
\mathcal{H}_{\phi}^{K_{n}(\infty)}=\left\{\eta \in \mathcal{H}_{\phi} \mid \pi_{\phi}^{(2)}(g) \eta=\eta \text { for all } g \in K_{n}(\infty)\right\}
$$

and let $P_{n}$ be the orthogonal projection onto $\mathcal{H}_{\phi}^{K_{n}(\infty)}$.
Lemma 14. $\bigcup_{n=0}^{\infty} \mathcal{H}_{\phi}^{K_{n}(\infty)}$ is a dense subspace in $\mathcal{H}_{\phi}$. In different terms, $\lim _{n \rightarrow \infty} P_{n}=\mathcal{I}_{\mathcal{H}_{\phi}}$ in the strong operator topology.

Proof. It follows from the definition of $\pi_{\phi}^{(2)}$ (see (4.2)) that

$$
\begin{equation*}
\left[\pi_{\phi}\left(G_{n}\right) \xi_{\phi}\right] \subset \mathcal{H}_{\phi}^{K_{n}(\infty)} \tag{4.3}
\end{equation*}
$$

On the other hand, $\xi_{\phi}$ is a cyclic vector. That is, $\left[\bigcup_{n=1}^{\infty} \pi_{\phi}\left(G_{n}\right) \xi_{\phi}\right]=\mathcal{H}_{\phi}$. Now our statement follows from (4.3).

Remind a construction of asymptotic operators which appears in [2], [3]. Consider the transposition $(i, n) \in \mathfrak{S}_{\infty}$ and the operator

$$
\begin{equation*}
\mathcal{O}_{k}=\lim _{n \rightarrow \infty} \frac{1}{n} \sum_{l=1}^{n} \pi_{\phi}((k, l)) . \tag{4.4}
\end{equation*}
$$

The limit exists in the strong operator topology.
Lemma 15. Let $i(p)$ be an element of $p \in \mathbb{N} / s$. Given any $\gamma=\left(\gamma_{1}, \gamma_{2}, \cdots, \gamma_{n}, \cdots\right) \in$ $\Gamma_{e}^{\infty}$, there exists $\tilde{\gamma} \in \Gamma_{e}^{\infty}$ with the property $\tilde{\gamma} \cdot s \cdot \gamma \cdot \tilde{\gamma}^{-1}=s \cdot \gamma^{\prime}$, where

$$
\begin{gathered}
\gamma_{s^{(l-1)}(i(p))}^{\prime}=e_{\Gamma} \quad \text { for all } \quad l=1,2, \ldots, \quad|p|-1 \quad \text { and } \quad p \in \mathbb{N} / s, \\
\gamma_{s(|p|-1)(i(p))}^{\prime}=\gamma_{s(|p|-1)(i(p))} \cdot \gamma_{s(|p|-2)(i(p))} \cdots \gamma_{i(p)}
\end{gathered}
$$

Proof. Let the $\tilde{\gamma}$ be defined as follows:

$$
\begin{gathered}
\tilde{\gamma}_{i(p)}=e_{\Gamma}, \tilde{\gamma}_{s(i(p))}=\gamma_{i(p)}^{-1}, \tilde{\gamma}_{s(2)}(i(p))=\gamma_{i(p)}^{-1} \cdot \gamma_{s(i(p))}^{-1}, \cdots \\
\tilde{\gamma}_{s(|p|-1)}(i(p))=\gamma_{i(p)}^{-1} \cdot \gamma_{s(i(p))}^{-1} \cdots \gamma_{s(|p|-2)(i(p))} \quad \text { for all } p \in \mathbb{N} / s
\end{gathered}
$$

Now our statement can be readily verified.
Lemma 16. Let s be a cycle from $\mathfrak{S}_{\infty}$. Suppose that for $\beta, \gamma \in \Gamma_{e}^{\infty}$ the following relations hold:

$$
\beta_{k}=\gamma_{k}=e_{\Gamma} \quad \text { for all } \quad k \in\{j \in \mathbb{N} \mid s(j)=j\}
$$

If $s \beta$ and s $\gamma$ are in the same conjugate class, then there exists $\tilde{\gamma} \in \Gamma_{e}^{\infty}$ such that s $\gamma=$ $\tilde{\gamma} \cdot s \beta \cdot \tilde{\gamma}^{-1}$.

Proof. One may assume without loss of generality that
$s(k)=k+1 \quad$ for $\quad k=1,2, \ldots, m-1, \quad s(m)=1 \quad$ and $\quad s(l)=l \quad$ for all $\quad l>m$.
By Lemma 15 there exist $\tilde{\gamma}, \tilde{\beta} \in \Gamma_{e}^{\infty}$ with the properties

$$
\begin{align*}
& \tilde{\gamma} \cdot s \cdot \gamma \cdot \tilde{\gamma}^{-1}=s \cdot \gamma^{\prime}, \tilde{\beta} \cdot s \cdot \beta \cdot \tilde{\beta}^{-1}=s \cdot \beta^{\prime}, \quad \text { where } \\
& \gamma_{k}^{\prime}=\beta_{k}^{\prime}=e_{\Gamma} \quad \text { for } \quad k=1,2, \ldots, m-1, m+1, \ldots \tag{4.5}
\end{align*}
$$

Let $s \in \mathfrak{S}_{\infty}$ and $\delta \in \Gamma_{e}^{\infty}$ be such that

$$
(t \delta) s \gamma^{\prime}(t \delta)^{-1}=s \beta^{\prime}
$$

One has the following relations:

$$
\begin{array}{ccc}
\delta_{2} \gamma_{1}^{\prime} & = & \beta_{t(1)}^{\prime} \delta_{1} \\
\delta_{3} \gamma_{2}^{\prime} & = & \beta_{t(2)}^{\prime} \delta_{2}  \tag{4.6}\\
\vdots & \vdots & \vdots \\
\delta_{m} \gamma_{m-1}^{\prime} & = & \beta_{t(m-1)}^{\prime} \delta_{m-1} \\
\delta_{1} \gamma_{m}^{\prime} & = & \beta_{t(m)}^{\prime} \delta_{m} .
\end{array}
$$

By assumptions of the Lemma, $t(\{1,2, \ldots, m\})=\{1,2, \ldots, m\}$, and we may assume that $t(k)=k$ for all $k>m$. Hence, there exists a map $f$ from $\mathbb{N}$ to $\mathbb{N}$ such that

$$
t(k)=s^{f(k)}(k) \quad \text { for } \quad k \in \mathbb{N}
$$

Now use the relation $t s=s t$ to obtain

$$
\begin{equation*}
f(k)=l \quad \text { for } \quad k=1,2, \ldots, m \tag{4.7}
\end{equation*}
$$

Since $s^{m}$ is the identity, it suffices to consider the case $l \in\{1,2, \ldots, m-1\}$.
Use (4.6) to obtain

$$
\begin{aligned}
\delta_{1}=\cdots & =\delta_{m-l}, \quad \delta_{m-l+1}=\cdots=\delta_{m} \\
\beta_{m}^{\prime} & =\delta_{m} \delta_{1}^{-1}, \quad \gamma_{m}^{\prime}=\delta_{1}^{-1} \delta_{m} .
\end{aligned}
$$

These relations together with (4.5) yield the following relation:

$$
\delta^{\prime} s \gamma^{\prime}\left(\delta^{\prime}\right)^{-1}=s \beta^{\prime}, \quad \text { where } \quad \delta^{\prime}=\left(\delta_{m}^{-1} \delta_{1}, \delta_{m}^{-1} \delta_{1}, \ldots, \delta_{m}^{-1} \delta_{1}, \ldots\right)
$$

## 5. A proof of the main result

The proof of Theorem 9 splits into a few lemmas.
For each indecomposable character $\phi$ let $\left(\pi_{\phi}, \mathcal{H}_{\phi}, \xi_{\phi}\right)$ denote the cyclic representation of the group $\Gamma \mathfrak{\imath} \mathfrak{S}_{\infty}$ associated to $\phi$ via the GNS-construction.
Lemma 17. If a $W^{*}$-algebra $\mathfrak{A}$ is generated by the operators $\pi_{\phi}\left(\Gamma_{e}^{\infty}\right),\left\{\mathcal{O}_{j}\right\}_{j \in \mathbb{N}}$, and $\mathcal{C}(\mathfrak{A})$ is a center of $\mathfrak{A}$, then $\left\{\mathcal{O}_{j}\right\}_{j \in \mathbb{N}} \subset \mathcal{C}(\mathfrak{A})$.

Proof. The relation $\mathcal{O}_{k} \cdot \mathcal{O}_{l}=\mathcal{O}_{l} \cdot \mathcal{O}_{k}$ allows an easy verification by definition (4.4) (see [2] or [3]).

Now prove the relation

$$
\begin{equation*}
\mathcal{O}_{l} \cdot \pi_{\phi}(\gamma)=\pi_{\phi}(\gamma) \cdot \mathcal{O}_{l} \quad \text { for all } \quad \gamma \in \Gamma_{e}^{\infty} \quad \text { and } \quad l \in \mathbb{N} \tag{5.1}
\end{equation*}
$$

Let $K_{n}^{\mathfrak{S}}(\infty)=K_{n}(\infty) \cap\left(\mathfrak{S}_{\infty} \times \mathfrak{S}_{\infty}\right)$ and $K_{n}^{\mathfrak{S}}(m)=K_{n}^{\mathfrak{S}}(\infty) \cap\left(G_{m} \times G_{m}\right)$, where $m>n$. If $P_{n}^{\mathfrak{G}}$ stands for the orthogonal projection onto $\mathcal{H}_{\phi}^{K_{n}^{\mathfrak{G}}(\infty)}$, then

$$
\begin{equation*}
P_{n}^{\mathfrak{S}}=\lim _{m \rightarrow \infty} \frac{1}{(m-n)!} \sum_{g \in K_{n}^{\mathfrak{G}}(m)} \pi_{\phi}^{(2)}(g) \tag{5.2}
\end{equation*}
$$

in the strong operator topology and $P_{n}^{\mathfrak{S}} \geq P_{n}{ }^{1}$. Hence, using (4.4) and (5.2), we obtain for $i \leq n<k$

$$
\begin{equation*}
P_{n}^{\mathfrak{S}} \mathcal{O}_{i} P_{n}^{\mathfrak{S}}=P_{n}^{\mathfrak{S}} \pi_{\phi}((i, k)) P_{n}^{\mathfrak{S}} \quad \text { and } \quad P_{n} \mathcal{O}_{i} P_{n}=P_{n} \pi_{\phi}((i, k)) P_{n} \tag{5.3}
\end{equation*}
$$

In the case when $\gamma_{l}=e$ the equality (5.1) easily follows from (4.4). Therefore, it suffices to prove (5.1) for the elements $\gamma=\gamma(\{l\})$ (see (1.3)).

[^1]If $i \leq n<k$, then, using (4.4), we have

$$
\begin{aligned}
& P_{n} \pi_{\phi}(\gamma(\{i\})) \mathcal{O}_{i} P_{n} \stackrel{\left\{P_{n}^{\mathfrak{G}} \geq P_{n}\right\}}{=} P_{n} P_{n}^{\mathfrak{S}} \pi_{\phi}(\gamma(\{i\})) \mathcal{O}_{i} P_{n}^{\mathfrak{S}} P_{n} \\
&\{(4.4),(5.2)\} \\
&=P_{n} \pi_{\phi}(\gamma(\{i\})) P_{n}^{\mathfrak{S}} \pi_{\phi}((i, k)) P_{n}^{\mathfrak{S}} P_{n} \\
&=P_{n} P_{n}^{\mathfrak{S}} \pi_{\phi}((i, k)) \pi_{\phi}(\gamma(\{k\})) P_{n}^{\mathfrak{S}} P_{n} \\
&=P_{n} P_{n}^{\mathfrak{S}} \pi_{\phi}((i, k)) \pi_{\phi}(\gamma(\{k\})) \pi_{\phi}^{(2)}\left(\left(\gamma(\{k\})^{-1}, \gamma(\{k\})^{-1}\right)\right) P_{n} \\
& \stackrel{(4.2)}{=} P_{n} P_{n}^{\mathfrak{G}} \pi_{\phi}^{(2)}\left(\left(e, \gamma(\{k\})^{-1}\right)\right) \pi_{\phi}((i, k)) P_{n} \\
&=P_{n} \pi_{\phi}^{(2)}((\gamma(\{k\}), \gamma(\{k\}))) \pi_{\phi}^{(2)}\left(\left(e, \gamma(\{k\})^{-1}\right)\right) \pi_{\phi}((i, k)) P_{n} \\
&=P_{n} \pi_{\phi}(\gamma(\{k\})) \pi_{\phi}((i, k)) P_{n}=P_{n} \pi_{\phi}((i, k)) \pi_{\phi}(\gamma(\{i\})) P_{n} \\
& \stackrel{(4.4)}{=} P_{n} \mathcal{O}_{i} \pi_{\phi}(\gamma(\{i\})) P_{n} .
\end{aligned}
$$

Since $\lim _{n \rightarrow \infty} P_{n}=\mathcal{I}_{\mathcal{H}_{\phi}}($ see Lemma 14 $)$, the relation

$$
\pi_{\phi}(\gamma(\{i\})) \mathcal{O}_{i}=\mathcal{O}_{i} \pi_{\phi}(\gamma(\{i\}))
$$

follows.
We use the notation $\left(i_{0}, i_{1}, \ldots, i_{q-1}\right)$ for the cyclic permutation $s$ which acts as follows

$$
s(i)=\left\{\begin{aligned}
i_{k+1(\bmod q)}, & \text { if } i=i_{k} \in\left\{i_{0}, i_{1}, \ldots, i_{q-1}\right\} \\
i, & \text { otherwise }
\end{aligned}\right.
$$

Lemma 18. If $\mathcal{O}_{i}$ is defined as in (4.4) and
$\mathbb{D}(m, n, q)=\left\{\vec{k}=\left(k_{1}, k_{2}, \ldots, k_{q}\right) \in \mathbb{N} \mid k_{i} \neq k_{j}\right.$ and $\left.m<k_{i} \leq n \forall i, j=1, \ldots, q\right\}$,
then for every positive integer $m$

$$
\mathcal{O}_{i}^{q}=\lim _{n \rightarrow \infty} \frac{1}{n^{q}} \sum_{\vec{k} \in \mathbb{D}(m, n, q)} \pi_{\phi}\left(\left(k_{q}, k_{q-1}, \ldots, k_{1}, i\right)\right)
$$

Proof. If we notice that

$$
\left(i, k_{1}\right) \cdot\left(i, k_{2}\right) \cdots\left(i, k_{q}\right)=\left(k_{q}, k_{q-1}, \ldots, k_{1}, i\right)
$$

for pairwise different $i, k_{1}, k_{2}, \ldots, k_{q}$ and $\operatorname{Card}(\mathbb{D}(m, n))=\prod_{j=0}^{q-1}(n-m-j)$, the proof becomes obvious.

Lemma 19. Let $g=\prod_{p \in \mathbb{N} / s} s_{p} \cdot \gamma(p)$ be a decomposition of $g=s \cdot \gamma \in \Gamma \imath \mathfrak{S}_{\infty}$ (see (1.4)) and $i(p)$ any element from $p \in \mathbb{N} / s$. Define $\gamma^{(i(p))} \in \Gamma_{e}^{\infty}$ as follows:
$(5.4) \gamma_{k}^{(i(p))}=\left\{\begin{aligned} & \gamma_{i(p)} \cdot \gamma_{s^{-1}(i(p))} \cdots \gamma_{s}^{(-|p|+2)(i(p))} \cdot \gamma_{s^{(-|p|+1)}(i(p))}, \\ & e, \text { if } k=i(p), \\ & \text { otherwise. }\end{aligned}\right.$
If $\phi$ is an indecomposable character on $\Gamma \mathfrak{\mathfrak { S } _ { \infty }}$, then

$$
\begin{equation*}
\left(\pi_{\phi}(s \cdot \gamma) \prod_{j} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right)=\prod_{p \in \mathbb{N} / s}\left(\pi_{\phi}\left(\gamma^{(i(p))}\right) \mathcal{O}_{i(p)}^{|p|-1+\sum_{j \in p} r_{j}} \xi_{\phi}, \xi_{\phi}\right) \tag{5.5}
\end{equation*}
$$

Proof. By Proposition 7 we have

$$
\begin{equation*}
\left(\pi_{\phi}(s \cdot \gamma) \prod_{j} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right)=\prod_{p \in \mathbb{N} / s}\left(\pi_{\phi}\left(s_{p} \cdot \gamma(p)\right) \prod_{j \in p} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right) \tag{5.6}
\end{equation*}
$$

Therefore it suffices to prove (5.5) in the case when $s$ is a single cycle and $\gamma=\gamma(p)$, where $p \in \mathbb{N} / s$ and $|p|>1$. Let $s=\left(i_{1}, i_{2}, \ldots, i_{|p|}\right)$. By a virtue of Lemma 16 , we find $\tilde{\gamma} \in \Gamma_{e}^{\infty}$ such that

$$
\begin{equation*}
\tilde{\gamma} \cdot s \cdot \gamma \cdot \tilde{\gamma}^{-1}=s \cdot \gamma^{\left(i_{1}\right)} \tag{5.7}
\end{equation*}
$$

Thus, by Lemma 17,

$$
\begin{equation*}
\left(\pi_{\phi}(s \cdot \gamma) \prod_{j \in p} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right)=\left(\pi_{\phi}\left(\gamma^{\left(i_{1}\right)}\right) \pi_{\phi}(s) \prod_{j \in p} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right) \tag{5.8}
\end{equation*}
$$

Let

$$
\mathfrak{S}_{\infty}^{j}=\left\{\tau \in \mathfrak{S}_{\infty} \mid \tau(j)=j\right\}
$$

Now use Lemma 18 to obtain

$$
\begin{aligned}
& \left(\pi_{\phi}\left(\gamma^{\left(i_{1}\right)}\right) \pi_{\phi}(s) \prod_{j \in p} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right) \\
& \quad=\lim _{n \rightarrow \infty} \frac{1}{n^{q}} \sum_{\vec{k} \in \mathbb{D}(m, n, q)}\left(\pi _ { \phi } ( \gamma ^ { ( i _ { 1 } ) } ) \pi _ { \phi } \left(\left(k_{r_{i_{1}}}^{\left(i_{1}\right)}, k_{r_{i_{1}-1}}^{\left(i_{1}\right)}, \ldots, k_{1}^{\left(i_{1}\right)}, i_{2},\right.\right.\right. \\
& \left.\left.\left.\quad k_{r_{i_{2}}}^{\left(i_{2}\right)}, \ldots, k_{1}^{\left(i_{2}\right)}, i_{3}, \ldots, i_{|p|}, k_{r_{i_{|p|} \mid}}^{\left(i_{|p|}\right)}, \ldots, k_{1}^{\left(i_{|p|}\right)}, i_{1}\right)\right) \xi_{\phi}, \xi_{\phi}\right)
\end{aligned}
$$

where

$$
\vec{k}=\left(k_{r_{i_{1}}}^{\left(i_{1}\right)}, k_{r_{i_{1}}-1}^{\left(i_{1}\right)}, \ldots, k_{1}^{\left(i_{1}\right)}, k_{r_{i_{2}}}^{\left(i_{2}\right)}, \ldots, k_{1}^{\left(i_{2}\right)}, \ldots, k_{r_{i_{|p|} \mid}}^{\left(i_{|p|}\right)}, \ldots, k_{1}^{\left(i_{|p|}\right)}\right), \quad q=\sum_{j \in p} r_{j}
$$

Hence, by the relation $\tau \cdot \gamma^{\left(i_{1}\right)} \tau^{-1}=\gamma^{\left(i_{1}\right)}\left(\tau \in \mathfrak{S}_{\infty}^{i_{1}}\right)$, we have

$$
\begin{aligned}
& \left(\pi_{\phi}\left(\gamma^{\left(i_{1}\right)}\right) \pi_{\phi}(s) \prod_{j \in p} \mathcal{O}_{j}^{r_{j}} \xi_{\phi}, \xi_{\phi}\right) \\
& \quad=\lim _{n \rightarrow \infty} \frac{1}{n^{q^{\prime}}} \sum_{\vec{k} \in \mathbb{D}\left(m, n, q^{\prime}\right)}\left(\pi _ { \phi } ( \gamma ^ { ( i _ { 1 } ) } ) \pi _ { \phi } \left(\left(k_{r_{i_{1}}}^{\left(i_{1}\right)}, k_{r_{i_{1}}-1}^{\left(i_{1}\right)}, \ldots, k_{1}^{\left(i_{1}\right)}, i_{2},\right.\right.\right. \\
& \left.\left.\left.\quad k_{r_{i_{2}}}^{\left(i_{2}\right)}, \ldots, k_{1}^{\left(i_{2}\right)}, i_{3}, \ldots, i_{|p|}, k_{r_{i|p|}}^{\left(i_{|p|}\right)}, \ldots, k_{1}^{\left(i_{|p|}\right)}, i_{1}\right)\right) \xi_{\phi}, \xi_{\phi}\right)
\end{aligned}
$$

where

$$
\begin{gathered}
\vec{k}=\left(k_{r_{i_{1}}}^{\left(i_{1}\right)}, k_{r_{i_{1}}-1}^{\left(i_{1}\right)}, \ldots, k_{1}^{\left(i_{1}\right)}, i_{2}, k_{r_{i_{2}}}^{\left(i_{2}\right)}, \ldots, k_{1}^{\left(i_{2}\right)}, i_{3}, \ldots, i_{|p|}, k_{r_{i_{|p|} \mid}}^{\left(i_{|p|}\right)}, \ldots, k_{1}^{\left(i_{|p|}\right)}\right) \\
q^{\prime}=|p|-1+\sum_{j \in p} r_{j} .
\end{gathered}
$$

This relation, in view of Lemma 18, implies the statement of Lemma 19.
We use the notation $\mathfrak{A}_{j}$ for the $W^{*}$-algebra generated by $\pi_{\phi}(\gamma), \gamma=\left(e, \cdots, e, \gamma_{j}, e, \cdots\right)$, and $\mathcal{O}_{j}$. Given an operator $A$ from $\mathfrak{A}_{j}$, denote by $A^{(k)}$ its copy in $\mathfrak{A}_{k}$ :

$$
A^{(k)}=\pi_{\phi}((j, k)) A \pi_{\phi}((j, k)) \quad\left(A^{(j)}=A\right)
$$

The next assertion follows from Lemma 19.

Lemma 20. Let $s, i(p)$ be the same as in Lemma 19. If $A_{j}, B_{j} \in \mathfrak{A}_{j}$, then

$$
\begin{align*}
& \left(\pi_{\phi}(s) \prod_{j} A_{j} \xi_{\phi}, \prod_{j} B_{j} \xi_{\phi}\right) \\
& \quad=\prod_{p \in \mathbb{N} / s}\left(A_{i(p)}^{(i(p))}\left(B_{i(p)}^{(i(p))}\right)^{*} A_{s^{-1}(i(p))}^{(i(p))}\left(B_{s^{-1}(i(p))}^{(i(p))}\right)^{*}\right.  \tag{5.9}\\
& \left.\quad \cdots A_{s^{1-|p|}(i(p))}^{(i(p))}\left(B_{s^{1-|p|(i(p))}}^{(i(p))}\right)^{*} \mathcal{O}_{i(p)}^{|p|-1} \xi_{\phi}, \xi_{\phi}\right) .
\end{align*}
$$

The following lemma is an analogue of Theorem 1 from [3].
Lemma 21. Let $\Delta=[a, b]$ be an interval in $[-1,0]$ or in $[0,1]$ with the property $\min \{|a|,|b|\}>\varepsilon>0$. If $E_{\Delta}^{(i)}$ is a spectral projection of $\mathcal{O}_{i}$ corresponding to $\Delta$, then for any orthogonal projection $E$ from $\mathfrak{A}_{i}$ one has $\left(E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)^{2} \geq \varepsilon\left(E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)$.
Proof. Using Lemmas 17 and 20, we have

$$
\begin{align*}
& \left|\left(\pi_{\phi}((i, i+1)) E E_{\Delta}^{(i)} \xi_{\phi}, E E_{\Delta}^{(i)} \xi_{\phi}\right)\right|  \tag{5.10}\\
& \quad=\left|\left(\mathcal{O}_{i} E E_{\Delta}^{(i)} \xi_{\phi}, E E_{\Delta}^{(i)} \xi_{\phi}\right)\right|>\varepsilon\left|\left(E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)\right| .
\end{align*}
$$

On the other hand, under the assumption $E^{(i+1)}=\pi_{\phi}((i, i+1)) E \pi_{\phi}((i, i+1))$, one has

$$
E E_{\Delta}^{(i)} \cdot E^{(i+1)} E_{\Delta}^{(i+1)} \cdot \pi_{\phi}((i, i+1))=\pi_{\phi}((i, i+1)) \cdot E E_{\Delta}^{(i)} \cdot E^{(i+1)} E_{\Delta}^{(i+1)}
$$

Therefore,

$$
\begin{aligned}
& \left|\left(\pi_{\phi}((i, i+1)) E E_{\Delta}^{(i)} \xi_{\phi}, E E_{\Delta}^{(i)} \xi_{\phi}\right)\right| \\
& \quad=\left|\left(\pi_{\phi}((i, i+1)) E^{(i+1)} E_{\Delta}^{(i+1)} E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)\right| \\
& \quad \leq\left|\left(E^{(i+1)} E_{\Delta}^{(i+1)} E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)\right| \stackrel{(\text { Prop. 7) }}{=}\left(E E_{\Delta}^{(i)} \xi_{\phi}, \xi_{\phi}\right)^{2}
\end{aligned}
$$

Hence, using (5.10), we obtain our statement.
The following statement is well known (see [3]) and also follows from Lemma 21.
Corollary 22. There exists at most countable set of numbers $\alpha_{i}, \beta_{i}$ from $(0,1)$ and a set of pairwise orthogonal projections $\left\{E^{(k)}\left(\alpha_{i}\right), E^{(k)}\left(\beta_{i}\right)\right\} \subset \mathfrak{A}_{k}$ such that

$$
\begin{equation*}
\mathcal{O}_{k}=\sum \alpha_{i} E^{(k)}\left(\alpha_{i}\right)-\sum \beta_{i} E^{(k)}\left(\beta_{i}\right) \tag{5.11}
\end{equation*}
$$

The following assertion is an analogue of Theorem 2 from [3].
Lemma 23. Let $r$ be a number from $\left\{\alpha_{i}, \beta_{i}\right\}$ and let $E$ be any projection from $\mathfrak{A}_{k}$. If $\left(E \cdot E^{(k)}(r) \xi_{\phi}, \xi_{\phi}\right)=r \nu(r) \neq 0$, then $\nu(r) \in \mathbb{Z}$.
Proof. For completeness of the proof, we use the arguments of Kerov, Olshanski, Vershik and Okounkov from [1] and [3].

For any $m \in \mathbb{N}$, define the projection $e_{m}(r)$ as follows:

$$
\begin{gathered}
e_{m}(r)=\prod_{j=1}^{m} E^{(j)} \cdot E^{(j)}(r), \quad \text { where } \\
E^{(j)}=\pi_{\phi}((j, k)) E \pi_{\phi}((j, k)), \quad E^{(j)}(r)=\pi_{\phi}((j, k)) E^{(k)}(r) \pi_{\phi}((j, k))
\end{gathered}
$$

Let $\mathbb{P}_{m}(s)$ be the set of orbits $s$ on $\{1,2, \ldots, m\}$. If $s \in \mathfrak{S}_{m}$, then by Lemma 20 we obtain

$$
\begin{equation*}
\left(\pi_{\phi}(s) e_{m}(r) \xi_{\phi}, e_{m}(r) \xi_{\phi}\right)=\nu(r)^{\left|\mathbb{P}_{m}(s)\right|} \prod_{p \in \mathbb{P}_{m}(s)} r^{|p|} \tag{5.12}
\end{equation*}
$$

Set $\phi_{r}(s)=\frac{\left(\pi_{\phi}(s) e_{m}(r) \xi_{\phi}, e_{m}(r) \xi_{\phi}\right)}{\left(e_{m}(r) \xi_{\phi}, e_{m}(r) \xi_{\phi}\right)}$. Using (5.12), we have

$$
\begin{equation*}
\phi_{r}(s)=\frac{\nu(r)^{\left|\mathbb{P}_{m}(s)\right|}}{\nu(r)^{m}} \tag{5.13}
\end{equation*}
$$

Therefore, $\phi_{r}$ is an indecomposable character on $\mathfrak{S}_{\infty}$ in view of Proposition 7.
We following G. Olshanski (see [6]) in expounding the proof of the following formula:

$$
\begin{equation*}
\sum_{s \in \mathfrak{S}_{m}} \operatorname{sgn}(s) t^{\left|\mathbb{P}_{m}(s)\right|}=t(t-1) \cdots(t-m+1) \tag{5.14}
\end{equation*}
$$

For that, we consider the canonical projection $p_{m, m-1}$ from $\mathfrak{S}_{m}$ onto $\mathfrak{S}_{m-1}$

$$
\left(p_{m, m-1}(s)\right)(i)=\left\{\begin{aligned}
s(i), & \text { if } s(i)<m \\
s(m), & \text { if } s(i)=m
\end{aligned}\right.
$$

Since $\left|\mathbb{P}_{m-1}\left(p_{m, m-1}(s)\right)\right|=\left|\mathbb{P}_{m}(s)\right|$ when $s \notin \mathfrak{S}_{m-1}$, and $\left|\mathbb{P}_{m-1}\left(p_{m, m-1}(s)\right)\right|=$ $\left|\mathbb{P}_{m}(s)\right|-1$ when $s \in \mathfrak{S}_{m-1}$, then

$$
\begin{aligned}
& \sum_{s \in \mathfrak{S}_{m}} \operatorname{sgn}(s) t^{\left|\mathbb{P}_{m}(s)\right|}=\sum_{s \in \mathfrak{S}_{m-1} \tilde{s} \in \mathfrak{S}_{m}:} \sum_{p_{m, m-1}(\tilde{s})=s} \operatorname{sgn}(s) t^{\left|\mathbb{P}_{m}(s)\right|} \\
& \quad=t \cdot \sum_{s \in \mathfrak{S}_{m-1}} t^{\left|\mathbb{P}_{m}(s)\right|}-(m-1) \cdot \sum_{s \in \mathfrak{S}_{m-1}} t^{\left|\mathbb{P}_{m}(s)\right|}=(t-m+1) \sum_{s \in \mathfrak{S}_{m-1}} t^{\left|\mathbb{P}_{m}(s)\right|}
\end{aligned}
$$

Hence (5.14) is now accessible by an elementary induction argument.
We follow the idea of A. Okounkov in considering the orthogonal projection

$$
\operatorname{Alt}_{r}(m)=\frac{1}{m!} \sum_{s \in \mathfrak{S}_{m}} \operatorname{sgn}(s) \pi_{\phi_{r}}(s)
$$

Since $\sum_{s \in \mathfrak{S}_{m}} \operatorname{sgn}(s) \phi_{r}(s) \geq 0$, then, using (5.13) and (5.14), we obtain for $r>0$

$$
\nu(r) \cdot(\nu(r)-1) \cdots(\nu(r)-m+1) \geq 0 \quad \text { for all } \quad m \in \mathbb{N}
$$

Thus, we get a contradiction in the case $\nu(r)>0$. The opposite case $\nu(r)<0$ can be considered in a similar way. For that, one should use the formula

$$
\sum_{s \in \mathfrak{S}_{m}} t^{\left|\mathbb{P}_{m}(s)\right|}=t(t+1) \cdots(t+m-1) \quad(\text { see }[6])
$$

and consider the projection

$$
\operatorname{Sym}_{r}(m)=\frac{1}{m!} \sum_{s \in \mathfrak{S}_{m}} \pi_{\phi_{r}}(s)
$$

Proof of Theorem 9. Let $E_{k}(r)$ be the spectral projection of $\mathcal{O}_{k}$ (see (4.4), (5.11)). By Lemma 23, for $r \neq 0$ the $W^{*}$-algebra $E_{k}(r) \mathfrak{A}_{k}$ (see p. 314) is finite-dimensional. On the other hand, use Lemma 17 to obtain the unitary representation $\left(\left.E_{k}(r) \pi_{\phi}\right|_{\Gamma}, E_{k}(r) \mathcal{H}_{\phi}\right)$ of the group $\Gamma$ in the space $E_{k}(r) \mathcal{H}_{\phi}$. Thus, the representations $\varrho^{r}$ for $r \neq 0$ as in Theorem 9 are the irreducible components of $\left(\left.E_{k}(r) \pi_{\phi}\right|_{\Gamma}, E_{k}(r) \mathcal{H}_{\phi}\right)$. The formula for characters follows from Lemmas 17 and 20. Finally, for each character as in Theorem 9 we construct the realization as in Section 2.
